**NEW 3-(4-OXO-4H-CHROMEN-2-YL)-(1H)-QUINOLIN-4-ONE COMPOUNDS,  
A PROCESS FOR THEIR PREPARATION  
AND PHARMACEUTICAL COMPOSITIONS CONTAINING THEM**

The present invention relates to new 3-(4-oxo-4H-chromen-2-yl)-(1H)-quinolin-4-one compounds, to a process for their preparation, to pharmaceutical compositions containing them and to their use as anti-cancer agents.

5     Anti-cancer therapeutic requirements call for the constant development of new anti-tumour agents with the aim of obtaining medicaments that are simultaneously more active and better tolerated.

Besides the fact that the compounds of the invention are new, they have very valuable anti-tumour properties.

10     On the one hand, they have a pro-apoptotic effect, an efficacy which is independent of the expression of p53, pRb and Bcl-2 and a marked anti-angiogenic effect and, on the other hand, they have synergy of action with a large number of cytostatic therapeutic agents without there being any additional haematotoxicity or, in general, any signs of intolerance.

15     As a result of those properties, the compounds of the invention are highly efficacious, well-tolerated adjuvants to chemotherapies and, at the same time, agents that are capable of maintaining and prolonging the effects of those chemotherapies when the latter are discontinued for various reasons: intolerance, finishing a course of treatment, discontinuation for reasons of surgery etc..

20     By virtue of their properties, the compounds of the invention can be advantageously associated with all cytotoxic treatments currently in use as well as with radiotherapies (without increasing the toxicity thereof) and the various hormonal therapies aimed at combatting cancers (breast and prostate).

More specifically, the present invention relates to compounds of formula (I) :

wherein :

- R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>6</sub>, R<sub>8</sub>, R<sub>9</sub> and R<sub>10</sub>, which may be the same or different, each represent a group selected from hydrogen, hydroxy, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkoxy, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl, arylalkoxy in which the alkoxy group is linear or branched (C<sub>1</sub>-C<sub>6</sub>), alkoxycarbonylalkoxy in which each of the alkoxy groups is linear or branched (C<sub>1</sub>-C<sub>6</sub>), and OR' wherein R' represents an ionised or ionisable group such as, for example, a phosphate group -PO(OH)<sub>2</sub>, a sulfate group -SO<sub>3</sub>H, carboxyalkylcarbonyl in which the alkyl group is linear or branched (C<sub>1</sub>-C<sub>6</sub>), dialkylaminoalkylcarbonyl in which each of the alkyl groups is linear or branched (C<sub>1</sub>-C<sub>6</sub>), or carboxyalkylaminocarbonyl in which the alkyl group is linear or branched (C<sub>1</sub>-C<sub>6</sub>),
- R<sub>5</sub> represents a group selected from linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl, aryl and heteroaryl,
- R<sub>7</sub> represents a group selected from hydrogen, hydroxy, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkoxy, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl and (C<sub>3</sub>-C<sub>7</sub>)cycloalkyl, or R<sub>7</sub> represents a nitrogen-containing or oxygen-containing heterocycle,

to optical isomers thereof when they exist, to addition salts thereof with a pharmaceutically acceptable acid and to hydrates and solvates thereof.

Among the pharmaceutically acceptable acids there may be mentioned, without implying any limitation, hydrochloric acid, hydrobromic acid, sulphuric acid, phosphoric acid, acetic acid, trifluoroacetic acid, lactic acid, pyruvic acid, malonic acid, succinic acid, glutaric

acid, fumaric acid, tartaric acid, maleic acid, citric acid, ascorbic acid, oxalic acid, methanesulphonic acid, benzenesulphonic acid, camphoric acid.

An aryl group is understood to be phenyl, biphenyl, naphthyl or tetrahydronaphthyl, each of those groups being optionally substituted by one or more identical or different atoms or groups selected from halogen atoms and linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl groups, hydroxy groups, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkoxy groups, linear or branched (C<sub>1</sub>-C<sub>6</sub>)polyhaloalkyl groups, amino groups (optionally substituted by one or two linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl groups), nitro groups and (C<sub>1</sub>-C<sub>2</sub>)alkylenedioxy groups.

A heteroaryl group is understood to be a 5- to 12-membered group which either is monocyclic and aromatic or is bicyclic with at least one of the rings being of aromatic character and which contains one, two or three hetero atoms selected from oxygen, nitrogen and sulphur, it being understood that the heteroaryl group may be optionally substituted by one or more identical or different atoms or groups selected from halogen atoms and linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl groups, hydroxy groups, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkoxy groups, linear or branched (C<sub>1</sub>-C<sub>6</sub>)polyhaloalkyl groups and amino groups (optionally substituted by one or two linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl groups). Among the heteroaryl groups there may be mentioned, without implying any limitation, thienyl, pyridyl, furyl, pyrrolyl, imidazolyl, oxazolyl, isoxazolyl, thiazolyl, isothiazolyl, quinolyl, isoquinolyl and pyrimidinyl groups.

A nitrogen-containing heterocycle is understood to mean a saturated or unsaturated, 5- to 7-membered monocyclic group containing a nitrogen atom and optionally substituted by one or more groups selected from hydroxy, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkoxy, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl, aryl-(C<sub>1</sub>-C<sub>6</sub>)alkyl in which the alkyl moiety is linear or branched and amino-(C<sub>1</sub>-C<sub>6</sub>)alkyl in which the alkyl moiety is linear or branched and in which the amino group is optionally substituted by one or two linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl groups.

Nitrogen-containing heterocycles to which preference is given are optionally substituted piperidyl and tetrahydropyridyl groups.

An oxygen-containing heterocycle is understood to mean a saturated or unsaturated, 5- to 7-membered monocyclic group containing an oxygen atom and optionally substituted by one or more groups selected from hydroxy, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkoxy, linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl, aryl-(C<sub>1</sub>-C<sub>6</sub>)alkyl in which the alkyl moiety is linear or branched and amino-(C<sub>1</sub>-C<sub>6</sub>)alkyl in which the alkyl moiety is linear or branched and in which the amino group is optionally substituted by one or two linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkyl groups.

An advantageous aspect of the invention relates to compounds of formula (I) wherein R<sub>5</sub> represents an aryl group.

Another advantageous aspect of the invention relates to compounds of formula (I) wherein R<sub>7</sub> represents a hydrogen atom.

Another advantageous aspect of the invention relates to compounds of formula (I) wherein R<sub>7</sub> represents an optionally substituted nitrogen-containing heterocycle.

Preference is given to compounds of formula (I) wherein R<sub>5</sub> represents a phenyl group and R<sub>7</sub> represents a hydrogen atom or a substituted 1,2,3,6-tetrahydro-4-pyridyl group.

Among the preferred compounds of the invention there may be mentioned, more especially :

- 3-(5-hydroxy-4-oxo-4*H*-1-benzopyran-2-yl)-1-phenyl-1*H*-quinolin-4-one,
- 3-[5,7-dimethoxy-8-(1-methyl-1,2,5,6-tetrahydropyridin-4-yl)-4-oxo-4*H*-1-benzopyran-2-yl]-1-phenyl-1*H*-1,4-dihydroquinolin-4-one,
- 3-(5,7-dihydroxy-4-oxo-4*H*-1-benzopyran-2-yl)-1-phenyl-1*H*-1,4-dihydroquinolin-4-one
- and 3-[5,7-dihydroxy-8-(1-methyl-1,2,5,6-tetrahydropyridin-4-yl)-4-oxo-4*H*-1-benzopyran-2-yl]-1-phenyl-1*H*-1,4-dihydroquinolin-4-one.

The invention relates also to a process for the preparation of compounds of formula (I), which process is characterised in that a compound of formula (II) :

wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> are as defined for formula (I),

5 is reacted with diethyl ethoxymethylenemalonate to yield the compound of formula (III) :

wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> are as defined hereinbefore and Et represents an ethyl group,

which is cyclised under acid conditions to yield the compound of formula (IV) :

wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> and Et are as defined hereinbefore,

which is hydrolysed to yield the compound of formula (V) :

wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> and R<sub>5</sub> are as defined hereinbefore,

which is converted by the action of thionyl chloride into an acid chloride, which is then  
5 reacted with the compound of formula (VI) :

wherein R<sub>7</sub>, R<sub>8</sub>, R<sub>9</sub> and R<sub>10</sub> are as defined for formula (I),

to yield the compound of formula (VII) :

10 wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub>, R<sub>9</sub> and R<sub>10</sub> are as defined hereinbefore,

which is subjected to the action of a base to yield the compound of formula (VIII) :

wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, R<sub>5</sub>, R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub>, R<sub>9</sub> and R<sub>10</sub> are as defined hereinbefore,

and  indicates that the compound is obtained, depending on the molecules

involved, in the form of a keto-enol mixture,

which is then subjected to acid conditions to yield the compound of formula (I), which is purified, if necessary, according to a conventional purification technique, which is separated, if necessary, into its optical isomers according to a conventional separation technique and which is converted, if desired, into its addition salts with a pharmaceutically acceptable acid.

Compounds of formula (I) wherein one or more of the substituents R<sub>1</sub> to R<sub>4</sub> and R<sub>6</sub> to R<sub>10</sub> represent(s) a hydroxy group may also be obtained by cleaving compounds of formula (I) wherein the corresponding substituent(s) represent(s) a linear or branched (C<sub>1</sub>-C<sub>6</sub>)alkoxy group.

Compounds of formula (I) wherein one or more of the substituents R<sub>1</sub> to R<sub>4</sub> and R<sub>6</sub> to R<sub>10</sub> represent(s) an alkoxycarbonylalkoxy, arylalkoxy or OR' group may also be obtained starting from compounds of formula (I) wherein the corresponding substituent(s) represent(s) a hydroxy group.

Besides the fact that they are new, the compounds of the present invention have very valuable anti-tumour properties, making them of use in the treatment of cancers.

Among the types of cancer that may be treated by the compounds of the present invention, there may be mentioned, without implying any limitation, adenocarcinomas, carcinomas, sarcomas, gliomas and leukaemias.

5 They may also be used in therapeutic association with another anti-cancer agent such as, for example, paclitaxel, tamoxifen and its derivatives, cisplatin and its analogues, irinotecan and its metabolites, the various alkylating agents, the leading example of which is cyclophosphamide, etoposide, the vinca alkaloids, doxorubicin and other anthracyclines, and the nitrosoureas.

10 The invention relates also to pharmaceutical compositions comprising as active ingredient at least one compound of formula (I) together with one or more appropriate, inert, non-toxic excipients. Among the pharmaceutical compositions according to the invention there may be mentioned more especially those that are suitable for oral, parenteral (intravenous, intramuscular or sub-cutaneous) or nasal administration, tablets or dragées, sublingual tablets, capsules, lozenges, suppositories, creams, ointments, dermal gels, injectable preparations, drinkable suspensions etc..

15 The useful dosage can be adapted to the nature and severity of the disorder, the administration route, the age and weight of the patient and any associated treatments and ranges from 0.5 mg to 2 g per 24 hours in one or more administrations.

The following Examples illustrate the invention but do not limit it in any way.

The starting materials used are known products or are prepared according to known procedures.

20 The structures of the compounds described in the Examples were determined according to the usual spectrometric techniques (infrared, NMR, mass spectrometry).

**EXAMPLE 1 : 3-(7-Methoxy-4-oxo-4H-1-benzopyran-2-yl)-1-phenyl-1H-1,4-dihydroquinolin-4-one :**

Step A : Diethyl N-N-diphenylaminomethylenemalonate :

10 mmol of diethyl ethoxymethylenemalonate are added to 10 mmol of diphenylamine and the mixture is then heated at 140-150°C for 5 hours. After returning to ambient temperature, the solid that is formed is rinsed with 100 mL of diethyl ether and recrystallised from hexane to yield the expected product in the form of a brown solid.

Melting point : 146-148°C.

MS (EI, m/z) : 339.9 ( $M^+$ ).

Step B : Ethyl 4-oxo-1-phenyl-1H-1,4-dihydroquinoline-3-carboxylate :

13.3 g of polyphosphoric acid are added to 10 mmol of the compound obtained in the previous Step. The mixture (which gradually becomes liquid) is then heated at 150-160°C for 45 minutes and is then cooled to 90°C. After hydrolysis, the mixture is neutralised using 10 % NaOH solution to yield, after isolation, the expected product.

IR (NaCl plates,  $\text{cm}^{-1}$ ) : 1733 ( $\nu\text{C=O}$ ), 1610 ( $\nu\text{C=C}$ ), 1645 ( $\nu\text{C=O}$ ), 690 ( $\nu\text{C-H(ar)}$ ).

MS (EI, m/z) : 293.3 ( $M^+$ ).

Step C : 4-Oxo-1-phenyl-1H-1,4-dihydroquinoline-3-carboxylic acid :

To 10 mmol of the compound obtained in the previous Step, dissolved in methanol, there are added 38 mL of 2M NaOH solution. The reaction mixture is then heated at reflux of the methanol for 10 hours and the solvent is then removed *in vacuo*. Water is added to the residue obtained and the mixture is then neutralised with 4M HCl solution. The grey solid obtained is washed with water and then dried to yield the expected product.

Melting point : 210-213°C.

IR (KBr,  $\text{cm}^{-1}$ ) : 3320 ( $\nu\text{OH(acid)}$ ), 1733 ( $\nu\text{C=O}$ ), 1610 ( $\nu\text{C=C}$ ), 1645 ( $\nu\text{C=O}$ ), 690 ( $\nu\text{C-H(ar)}$ ).

MS (EI, m/z) : 265.3 ( $M^+$ ).

Step D : (2-Acetyl-5-methoxy)phenyl 4-oxo-1-phenyl-1H-1,4-dihydroquinoline-3-carboxylate :

10 mmol of the compound obtained in the previous Step are added to 20 mmol of thionyl chloride dissolved in dichloroethane. The reaction mixture is heated at reflux of the solvent for 2 hours and is then concentrated *in vacuo*, and the excess thionyl chloride is removed by distillation *in vacuo* with entrainment with dichloroethane, repeated several times.

The acid chloride thereby obtained (white solid) is added in small portions to 6.7 mmol of commercial 2-hydroxy-4-methoxyacetophenone dissolved in pyridine. After stirring for 12 hours under an inert atmosphere at ambient temperature, the reaction mixture is purified by chromatography on a silica column (eluant : CH<sub>2</sub>Cl<sub>2</sub>/MeOH : 95/5) to yield the expected product in the form of a yellow powder.

Melting point : 137-139°C.

IR (KBr, cm<sup>-1</sup>) : 2865 (νCH of OCH<sub>3</sub>), 1740 (νC=O), 1655 (νC=O), 1590-1575 (νC=C).

MS (electrospray, m/z ) : 413.4 (M<sup>+</sup>).

Step E : 3-[3-(2-Hydroxy-4-methoxyphenyl)-1,3-dioxoprop-1-yl]-1H-1-phenyl-1,4-dihydroquinolin-4-one :

Under an inert atmosphere and at ambient temperature, 12 mmol of potassium *tert*-butanolate are slowly added to 10 mmol of the compound obtained in the previous Step, dissolved in a mixture of dimethylformamide and tetrahydrofuran (35/75). The reaction mixture is stirred for 2 hours and is then poured into a solution of 55 mL of water at 0°C containing 1.3 mL of 10 % hydrochloric acid. The precipitate obtained is filtered off, rinsed with copious amounts of water and then dried. The solid obtained is purified by chromatography on a silica column (eluant : CH<sub>2</sub>Cl<sub>2</sub>) to yield the expected product in the form of a keto-enol mixture.

Melting point : 228-230°C.

Step F: 3-(7-Methoxy-4-oxo-4H-1-benzopyran-2-yl)-1-phenyl-1H-1,4-dihydroquinolin-4-one :

To 10 mmol of the compound obtained in the previous Step, dissolved in 25 mL of glacial acetic acid, there are slowly added 25 mL of a solution of acetic acid containing 20 % sulphuric acid. A yellow precipitate is formed. After 2 hours 30 minutes at ambient temperature, the mixture is poured into iced water (4°C). The insoluble material is filtered off and rinsed with copious amounts of water to yield the expected product in the form of a white powder.

Melting point : 297°C.

IR (cm<sup>-1</sup>) : 2825 (νOCH<sub>3</sub>), 1750 (νC=O), 1675 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 396.1 (M<sup>+</sup>).

Elemental microanalysis :

	% C	% H	% N
Calculated :	72.63	4.63	3.39
Found	72.46	4.57	3.27

**EXAMPLE 2** : 3-(7-Hydroxy-4-oxo-4H-1-benzopyran-2-yl)-1-phenyl-1H-quinolin-4-one :

10 mmol of the compound of Example 1 are added, with stirring, under an inert atmosphere and protected from light, to 500 mmol of phenol dissolved in 214 mL of hydriodic acid (57 % aqueous solution). The heterogeneous reaction mixture is then heated at 160°C for 15 hours. The initially yellow solution turns orange. After returning to ambient temperature, the solution is poured onto ice, and the precipitate obtained is rinsed with water and then with diethyl ether in order to remove the residual phenol, yielding, after recrystallisation, the expected product in the form of a yellow powder.

Melting point : 295-300°C (acetone)

IR (cm<sup>-1</sup>) : 3280 (νOH), 1770 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 381.1 (M<sup>+</sup>).

Elemental microanalysis :

	% C	% H	% N
<i>Calculated :</i>	72.17	4.29	3.51
<i>Found :</i>	72.37	4.37	3.55

5 **EXAMPLE 3 : 3-(6-Methoxy-4-oxo-4*H*-1-benzopyran-2-yl)-1-phenyl-1*H*-1,4-dihydroquinolin-4-one :**

The expected product is obtained according to the procedure described in Example 1 but replacing, in Step D, the 2-hydroxy-4-methoxyacetophenone by 2-hydroxy-5-methoxyacetophenone.

10 Melting point : 265°C.

IR (cm<sup>-1</sup>) : 2830 (νOCH<sub>3</sub>), 1740 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 396.1 (M<sup>+</sup>).

Elemental microanalysis :

	% C	% H	% N
15 <i>Calculated :</i>	72.63	4.63	3.39
<i>Found :</i>	72.74	4.46	3.36

**EXAMPLE 4 : 3-(5-Methoxy-4-oxo-4*H*-1-benzopyran-2-yl)-1-phenyl-1*H*-1,4-dihydroquinolin-4-one :**

20 The expected product is obtained according to the procedure described in Example 1 but replacing, in Step D, the 2-hydroxy-4-methoxyacetophenone by 2-hydroxy-6-methoxyacetophenone.

Melting point : 271°C.

IR (cm<sup>-1</sup>) : 2830 (νOCH<sub>3</sub>), 1744 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 396.1 (M<sup>+</sup>).

25 Elemental microanalysis :

	% C	% H	% N
<i>Calculated :</i>	72.63	4.63	3.39
<i>Found :</i>	72.46	4.57	3.27

**EXAMPLE 5 : 3-(5,7-Dimethoxy-4-oxo-4*H*-1-benzopyran-2-yl)-1-phenyl-1*H*-1,4-dihydroquinolin-4-one :**

Step A : 2,4-Dimethoxy-6-hydroxyacetophenone :

14.5 mmol of K<sub>2</sub>CO<sub>3</sub> are added, all at once, to 10 mmol of phloroacetophenone monohydrate dissolved in acetone. Under an inert atmosphere, 20 mmol of dimethyl sulphate are then added over a period of 30 minutes and the reaction mixture is heated at reflux of the acetone for 12 hours. After returning to ambient temperature, the mixture is poured into water to yield a white suspension which is then filtered. The white powder obtained is washed and is then recrystallised from methanol to yield the expected product.

Melting point : 80-81°C (methanol).

Step B : 3-(5,7-Dimethoxy-4-oxo-4*H*-1-benzopyran-2-yl)-1-phenyl-1*H*-1,4-dihydroquinolin-4-one :

The expected product is obtained according to the procedure described in Example 1 but replacing, in Step D, the 2-hydroxy-4-methoxyacetophenone by the compound obtained in Step A above.

Melting point : 282°C.

IR (cm<sup>-1</sup>) : 2825 (νOCH<sub>3</sub>), 1744 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 425.45 (M<sup>+</sup>).

Elemental microanalysis :

	% C	% H	% N
<i>Calculated</i> :	70.42	4.77	3.16
<i>Found</i> :	70.33	4.76	3.26

**EXAMPLE 6 : 3-(5-Hydroxy-4-oxo-4*H*-1-benzopyran-2-yl)-1-phenyl-1*H*-quinolin-4-one :**

The expected product is obtained according to the procedure described in Example 2, starting from the compound of Example 4.

Melting point : >300°C (acetone)

IR (cm<sup>-1</sup>) : 3200 (νOH), 1770 (νC=O), 1635 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 381.1 (M<sup>+</sup>).

Elemental microanalysis :

5		% C	% H	% N
	Calculated :	72.17	4.29	3.51
	Found :	72.33	4.40	3.65

**EXAMPLE 7 : 3-(5-Hydroxy-7-methoxy-4-oxo-4H-1-benzopyran-2-yl)-1-phenyl-1H-quinolin-4-one :**

10 11 mmol of BBr<sub>3</sub> (as a 1M solution in dichloromethane) are added over 15 minutes, under an inert atmosphere and protected from light, to 10 mmol of the compound of Example 5 as a suspension in dichloromethane, resulting in the formation of a yellow precipitate. The reaction mixture is stirred vigorously at ambient temperature for 6 hours and is then cooled to 0°C. Ethanol is then added and the solution is concentrated *in vacuo*. The residue  
15 obtained is then poured into an aqueous alcoholic solution (50 %) and the mixture is then vigorously stirred for 10 minutes. The precipitate obtained is filtered off and rinsed with water and then with diethyl ether to yield, after recrystallisation, the expected product in the form of a beige powder.

Melting point : 295-296°C (acetone)

20 IR (cm<sup>-1</sup>) : 3224 (νOH), 1780 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 411.41 (M<sup>+</sup>).

Elemental microanalysis :

		% C	% H	% N
	Calculated :	72.99	4.16	3.40
25	Found :	72.70	4.10	3.45

**EXAMPLE 8 : 3-(4-Oxo-4H-1-benzopyran-2-yl)-1-phenyl-1H-quinolin-4-one :**

The expected product is obtained according to the procedure described in Example 1 but replacing, in Step D, the 2-hydroxy-4-methoxyacetophenone by acetophenone.

Melting point : 327-328°C.

MS (electrospray, m/z) : 365.4 (M<sup>+</sup>).

Elemental microanalysis :

	% C	% H	% N
5 <i>Calculated</i> :	78.89	4.14	3.83
<i>Found</i> :	78.60	4.10	3.60

**EXAMPLE 9 :** 3-[5,7-Dimethoxy-8-(1-methyl-1,2,5,6-tetrahydropyridin-4-yl)-4-oxo-4H-1-benzopyran-2-yl]-1-phenyl-1H-1,4-dihydroquinolin-4-one :

10      Step A : 4-(2,4-Dimethoxy-6-hydroxy-5-methylcarbonylphenyl)-1-methyl-1,2,5,6-tetrahydropyridine:

To 10 mmol of the compound obtained in Step A of Example 5, dissolved in glacial acetic acid, there are added, slowly so as not to exceed 25°C, 11.5 mmol of 1-methylpiperidin-4-one. When the addition is complete, a stream of hydrogen chloride gas is bubbled through for 1 hour 40 minutes, and the reaction mixture is then heated at a temperature between 95  
15 and 100°C for 5 hours. The acetic acid is removed by distillation *in vacuo*, and the residual oil is then taken up in water and extracted with diethyl ether. The aqueous phase is made basic by adding 40 % NaOH solution. The precipitate obtained is filtered off, rinsed with copious amounts of water and recrystallised from petroleum ether to yield the expected product.

20      Melting point : 143-144°C.

IR (KBr, cm<sup>-1</sup>) : 3400-3200 (νOH), 2843 (νOCH<sub>3</sub>), 1680 (νC=O), 1655 (νC=C).

MS (EI, m/z) : 291 (M<sup>+</sup>).

Step B : 3-[5,7-Dimethoxy-8-(1-methyl-1,2,5,6-tetrahydropyridinyl)-4-oxo-4H-1-benzopyran-2-yl]-1-phenyl-1H-1,4-dihydroquinolin-4-one :

25      The expected product is obtained according to the procedure described in Example 1 but replacing, in Step D, the 2-hydroxy-4-methoxyacetophenone by the compound obtained in Step A above.

Melting point : 248-250°C (acetone).

IR (cm<sup>-1</sup>) : 2835 (νOCH<sub>3</sub>), 1755 (νC=O), 1675 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 520.6 (M<sup>+</sup>).

Elemental microanalysis :

5		% C	% H	% N
	Calculated :	73.28	5.10	5.22
	Found :	73.83	5.42	5.38

**EXAMPLE 10 : 3-(5,7-Dihydroxy-4-oxo-4H-1-benzopyran-2-yl)-1-phenyl-1H-1,4-dihydroquinolin-4-one :**

10 The expected product is obtained according to the procedure described in Example 2, starting from the compound of Example 5.

Melting point : 365-368°C (acetone).

IR (cm<sup>-1</sup>) : 3224 (νOH), 1780 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 397.4 (M<sup>+</sup>).

15 Elemental microanalysis :

		% C	% H	% N
	Calculated :	72.54	3.80	3.52
	Found :	72.20	4.01	3.33

**EXAMPLE 11 : Ethyl [2-(4-oxo-1-phenyl-1H-1,4-dihydroquinolin-3-yl)-4H-1-benzopyran-7-yloxy]acetate :**

20 To 10 mmol of the compound of Example 2, suspended in acetone, there are slowly added 20 mmol of potassium carbonate and then 20 mmol of ethyl bromoacetate. The mixture is heated at reflux of the solvent for 2 hours 30 minutes and then, after returning to ambient temperature, is poured into water. The insoluble material obtained is filtered off and rinsed  
25 with copious amounts of water to yield the expected product in the form of a white solid.

Melting point : 330°C.

IR (cm<sup>-1</sup>) : 1744 (νC=O), 1680 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray,  $m/z$ ) : 467.48 ( $M^+$ ).

Elemental microanalysis :

	% C	% H	% N
Calculated :	71.94	4.53	3.00
Found :	71.70	4.77	3.40

**EXAMPLE 12 : 3-[5,7-Dimethoxy-8-(1-methyl-1,2,5,6-tetrahydropyridin-4-yl)-4-oxo-4H-1-benzopyran-2-yl]-1-methyl-1H-1,4-dihydroquinolin-4-one :**

Step A : Diethyl N-phenylaminomethylenemalonate :

The expected product is obtained according to the procedure described in Step A of Example 1, but replacing the diphenylamine by aniline.

Melting point : 46-48°C (hexane).

MS (EI,  $m/z$ ) : 263 ( $M^+$ ).

Step B : Diethyl N-methyl-N-phenylaminomethylenemalonate :

To 10 mmol of the compound obtained in the previous Step, dissolved in tetrahydrofuran, there are added, slowly (in small portions) and under an inert atmosphere, 12 mmol of 95 % NaH and then, dropwise, 30 mmol of iodomethane. The reaction mixture is then stirred, at ambient temperature and under an inert atmosphere, for 12 hours. 1 mL of methanol is added in order to neutralise the excess of sodium hydride. The solution is then concentrated *in vacuo*, and then water is added to the residual oil obtained. After extraction with dichloromethane, the combined organic phases are dried, filtered and concentrated under reduced pressure to yield the expected product in the form of a colourless oil.

MS (EI,  $m/z$ ) : 276 ( $M^+$ ).

Step C : 3-[5,7-Dimethoxy-8-(1-methyl-1,2,5,6-tetrahydropyridin-4-yl)-4-oxo-4H-1-benzopyran-2-yl]-1-methyl-1H-1,4-dihydroquinolin-4-one :

The expected product is obtained according to the procedure described in Steps B to F of Example 1 but replacing, in Step B, the compound obtained in Step A of Example 1 by the compound obtained in Step B above and replacing, in Step D, the 2-hydroxy-4-methoxyacetophenone by the compound obtained in Step A of Example 9.

Melting point : 289-291°C (acetone).

IR (cm<sup>-1</sup>) : 2835 (νOCH<sub>3</sub>), 1755 (νC=O), 1675 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 458.5 (M<sup>+</sup>).

Elemental microanalysis :

	% C	% H	% N
Calculated :	70.73	5.72	6.11
Found :	70.25	5.48	5.78

**EXAMPLE 13** : 3-[5,7-Dimethoxy-8-[1-(4-fluorobenzyl)-1,2,5,6-tetrahydropyridin-4-yl]-4-oxo-4H-1-benzopyran-2-yl]-1-phenyl-1H-1,4-dihydroquinolin-4-one :

Step A : 1-(4-Fluorobenzyl)piperidin-4-one :

To 10 mmol of piperidin-4-one hydrochloride monohydrate and 20 mmol of triethylamine, dissolved in dichloromethane, there are slowly added 10 mmol of 4-fluorobenzyl chloride; the reaction mixture is then heated at reflux of the solvent for 48 hours, with vigorous stirring. After returning to ambient temperature, water is added and then, after separation of the phases, the organic phase is dried, filtered and concentrated *in vacuo* to yield the expected product in the form of an orange oil.

MS (EI, m/z) : 207.2 (M<sup>+</sup>).

Step B : 4-(3-Acetyl-4,6-dimethoxy-2-hydroxyphenyl)-1-(4-fluorobenzyl)-1,2,5,6-tetrahydropyridine :

To 10 mmol of the compound obtained in Step A of Example 5, dissolved in glacial acetic acid, there are added, slowly so as not to exceed 25°C, 11 mmol of the compound obtained in Step A above. When the addition is complete, a stream of hydrogen chloride is passed through the solution for 2 hours, and the reaction mixture is then heated at a temperature between 95 and 100°C for 5 hours. The acetic acid is removed by distillation *in vacuo*, and then water is added to the residual oil obtained. After extraction with diethyl ether, the aqueous phase is made basic using 40 % NaOH solution. The precipitate obtained is filtered off, rinsed with copious amounts of water and recrystallised from a mixture of ether / ethyl acetate (90 / 10) to yield the expected product in the form of a beige solid.

Melting point : 147-150°C.

IR (KBr, cm<sup>-1</sup>) : 3400-3200 (νOH), 2871 (νCH of OCH<sub>3</sub>), 1633 (νC=O), 1655 (νC=C), 1350-1100 (νC-F).

MS (EI, m/z ) : 385.4 (M<sup>+</sup>).

Step C : 3-[5,7-Dimethoxy-8-[1-(4-fluorobenzyl)-1,2,5,6-tetrahydropyridin-4-yl]-4-oxo-4H-1-benzopyran-2-yl]-1-phenyl-1H-1,4-dihydroquinolin-4-one :

The expected product is obtained according to the procedure described in Example 1, but replacing, in Step D, the 2-hydroxy-4-methoxyacetophenone by the compound obtained in Step B above.

Melting point : 218-219°C (acetone).

IR (cm<sup>-1</sup>) : 2835 (νOCH<sub>3</sub>), 1755 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z ) : 614.66 (M<sup>+</sup>).

**EXAMPLE 14** : 3-[5,7-Dihydroxy-8-(1-methyl-1,2,5,6-tetrahydropyridin-4-yl)-4-oxo-4H-1-benzopyran-2-yl]-1-phenyl-1H-1,4-dihydroquinolin-4-one :

10 mmol of the compound of Example 9 are dispersed in pyridinium chloride; the mixture is then heated at 180°C, in a sealed tube, for 12 hours. After cooling to 100°C, the reaction

mixture is then poured into water and the pH is adjusted to 7-8 using 10 % sodium hydrogen carbonate solution (the pH is initially 1). The insoluble material is separated off by filtration and rinsed with water to yield the expected product.

Melting point : >250°C.

IR (cm<sup>-1</sup>) : 3330 (νOH), 1785 (νC=O), 1665 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 492.5 (M<sup>+</sup>).

**EXAMPLE 18** : 3-[5,7-Dimethoxy-8-[1-(4-methoxybenzyl)-1,2,5,6-tetrahydropyridin-4-yl]-4-oxo-4*H*-1-benzopyran-2-yl]-1-phenyl-1*H*-1,4-dihydroquinolin-4-one :

The expected product is obtained according to the procedure described in Example 13 but replacing, in Step A, the 4-fluorobenzyl chloride by 4-methoxybenzyl chloride.

Melting point : 232-235°C (acetone).

IR ( $\text{cm}^{-1}$ ) : 2845 ( $\nu\text{OCH}_3$ ), 1750 ( $\nu\text{C=O}$ ), 1655 ( $\nu\text{C=O}$ ), 1570-1590 ( $\nu\text{C=C}$ ).

MS (electrospray, m/z) : 626.7 ( $M^+$ ).

**EXAMPLE 19 : 3-[5,7-Dimethoxy-8-(1,2,5,6-tetrahydropyridin-4-yl)-4-oxo-4H-1-benzopyran-2-yl]-1-phenyl-1H-1,4-dihydroquinolin-4-one :**

To 10 mmol of the compound of Example 18 suspended in glacial acetic acid there is added, under an inert atmosphere, 0.9 mg of Pd/C (10 % by weight). The reaction mixture is heated at 70°C and stirred under an atmosphere of hydrogen at atmospheric pressure for 5 hours. The reaction mixture is then filtered over Celite and then washed with methanol. The solvents are removed by distillation *in vacuo*. Water pH-adjusted to 8-9 is added to the residue obtained. Extraction with the mixture CH<sub>2</sub>Cl<sub>2</sub> / MeOH (90/10) yields the expected product in the form of a white solid.

Melting point : 251-253°C (diethyl ether / acetone).

IR (cm<sup>-1</sup>) : 3387 (νN-H), 2880 (νOCH<sub>3</sub>), 1780 (νC=O), 1655 (νC=O), 1570-1590 (νC=C).

MS (electrospray, m/z) : 506.5 (M<sup>+</sup>).

**EXAMPLE 22 : 3-[5,7-Dimethoxy-8-[1-(2-dimethylaminoethyl)-1,2,5,6-tetrahydropyridin-4-yl]-4-oxo-4*H*-1-benzopyran-2-yl]-1-phenyl-1*H*-1,4-dihydroquinolin-4-one :**

15 The expected product is obtained according to the procedure described in Example 13 but replacing, in Step A, the 4-fluorobenzyl chloride by 2-chloro-N,N-dimethylethylamine.

**EXAMPLE 23 : 3-[5,7-Dihydroxy-8-[1-(2-dimethylaminoethyl)-1,2,5,6-tetrahydropyridin-4-yl]-4-oxo-4*H*-1-benzopyran-2-yl]-1-phenyl-1*H*-1,4-dihydroquinolin-4-one :**

20 The expected product is obtained according to the procedure described in Example 2, starting from the compound of Example 22.

## **PHARMACOLOGICAL STUDY OF COMPOUNDS OF THE INVENTION**

### **EXAMPLE 24 : *In vitro* study of the cytotoxicity due to compounds of the invention**

Eleven cell lines from cancers of different origins and sites (lung, breast, prostate, colon, blood, bladder, skin, ovary, brain) are cultured in order to study the various compounds in comparison to the reference substance.

The cells are incubated for 96 hours with various concentrations of compounds of the invention.

The *in vitro* cytotoxic activity is determined by the MTT [3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide] test as described by Carmichael in Cancer Res. - 1987 ; 47 (4) : 936-942.

The activity is expressed in terms of the IC<sub>50</sub>, that is to say the concentration which inhibits proliferation of the tumour cells by 50 %.

In this model, the compounds of the invention have an intrinsic cytotoxic activity with respect to one or more tumour cell lines.

By way of example, the compound of Example 9 has cytotoxic activity with respect to 8 of the 11 lines tested (IC<sub>50</sub> values of from 2 to 10 µM depending on the cell line used).

The compound of Example 14 has IC<sub>50</sub> values of from 0.05 to 0.25 µM with respect to 5 of the 11 lines tested.

### **EXAMPLE 25 : Synergistic effect, *in vitro*, of compounds of the invention in combination with known anti-cancer agents**

Three cell lines which are sensitive to three anti-cancer agents are used : breast cancer cells in association with treatment with tamoxifen (TXL), lung cancer cells in association with treatment with cisplatin (CDDP), and colon cancer cells in association with treatment with SN38, a metabolite of CPT-11 (irinotecan).

The tumour cells are incubated for 96 hours together with five different concentrations of each of the compounds of the invention and five concentrations of each of the anti-cancer agents in association.

The *in vitro* cytotoxic activity is determined by the MTT test described in Example 24.

5 Analysis of the data is carried out according to the method of Chou and Talabay, published in Trends Pharmaceutical Sci. - 1983 ; 4 : 450.

The compounds of the invention show a synergistic effect with the different anti-cancer agents tested, that is to say they reinforce the cytotoxic activity of the anti-cancer agent administered simultaneously.

10 By way of example, the compounds of Examples 14 and 16 show a synergistic effect both with paclitaxel and with cisplatin.

#### **EXAMPLE 26 : Apoptotic effect of compounds of the invention**

Apoptosis is a natural mechanism which allows the human body to rid itself of abnormal cells such as cancerous cells.

15 Study of the pro-apoptotic effects of compounds of the invention is carried out on a prostate cancer line (LN CaP). The cells were incubated for periods ranging from 8 to 96 hours at the IC<sub>50</sub> concentration.

The TUNEL test was then carried out according to the method described by Sgonc in Trends Genetics - 1994 ; 10 : 41.

20 The compounds of the invention are capable of bringing about apoptosis, the maximum intensity of which occurs at different times depending on the compounds.

The compounds of the invention differ from previously described substances in their ability to bring about apoptosis earlier. By way of example, very high apoptosis is brought about early (8 hours) by the compound of Example 6.

**EXAMPLE 27 : Pharmaceutical composition**

5	Preparation formula for 1000 tablets each containing 10 mg of active ingredient	
	Compound of Example 9 .....	10 g
	Hydroxypropyl cellulose .....	2 g
	Wheat starch .....	10 g
	Lactose .....	100 g
10	Magnesium stearate .....	3 g
	Talc .....	3 g
